

## What is a Network Discovery?

When we meet with a business about their technology needs one of the first things we ask is, do you have any network documentation to help us understand how your network is put together? Majority of the responses are, “What is that?”

A Network Assessment is basically an owner’s manual or blue print of how your current infrastructure is put together. Most small to medium sized businesses are not IT savvy (yet), and do not know where to start when upgrading their infrastructure and securing their data.

*We create documentation, action plans, then provide recommendations to reach your goals:*

### **Develop a Disaster Recovery Plan –**

It is imperative to have a plan in place to ensure your data is secured, retrievable, and your network can stay running.

### **Risk Assessment –**

It’s important to know where your network has security gaps and possible hardware failure potential.

### **Network Documentation –**

We will give you a clear understanding of how your network is put together, saving you time and money.

### **Hardware and Software Asset List –**

We examine your hardware and software for reliability and life cycle changes.

### **Best Practice Recommendations –**

We provide an action plan with step-by-step directions to get you to your goals.
